

Observation on User behaviour in app vector with open replay

Onboarding page

1. User are landing in dashboard page and starting to search in package area, Instead of clicking, add app button.

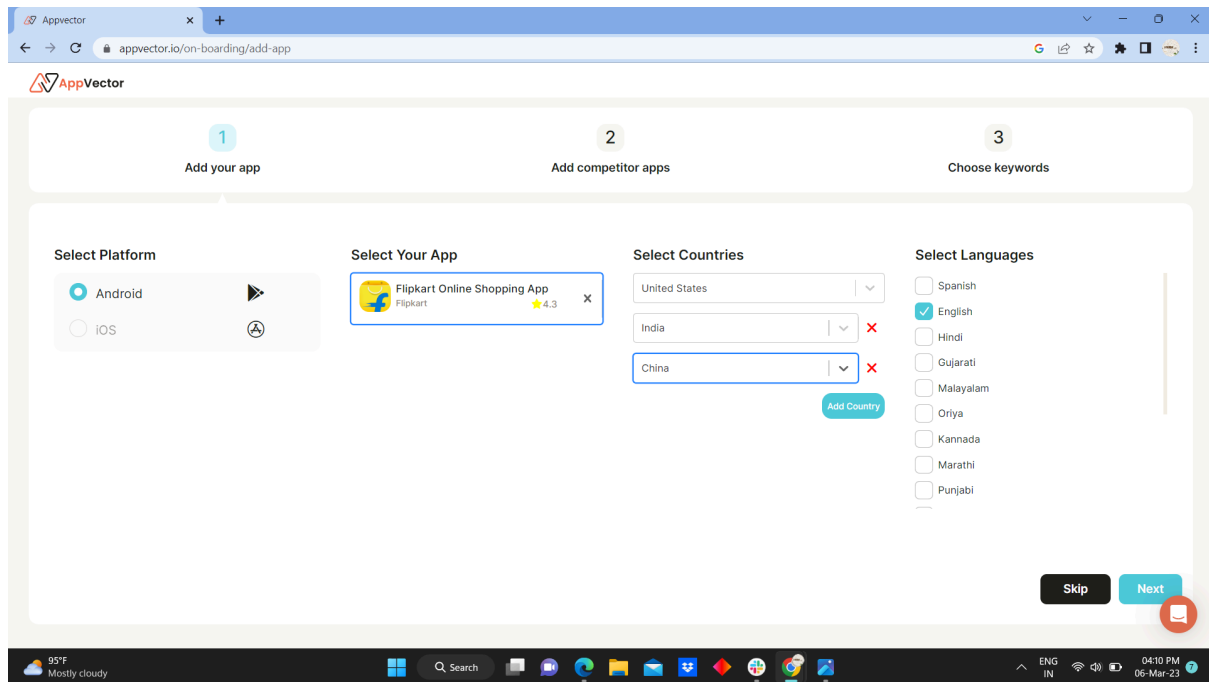

Need to promote add your app button when user did not added any app -new user.

2. When user select more country and language container show 9 list of languages,after that user need to scroll down the list to select.

For example - if user select US+ India + China , the total language list is 15. But user will see 9 language as in container and need to scroll down to see other.

Need to show list of language quickly with respective country is selected

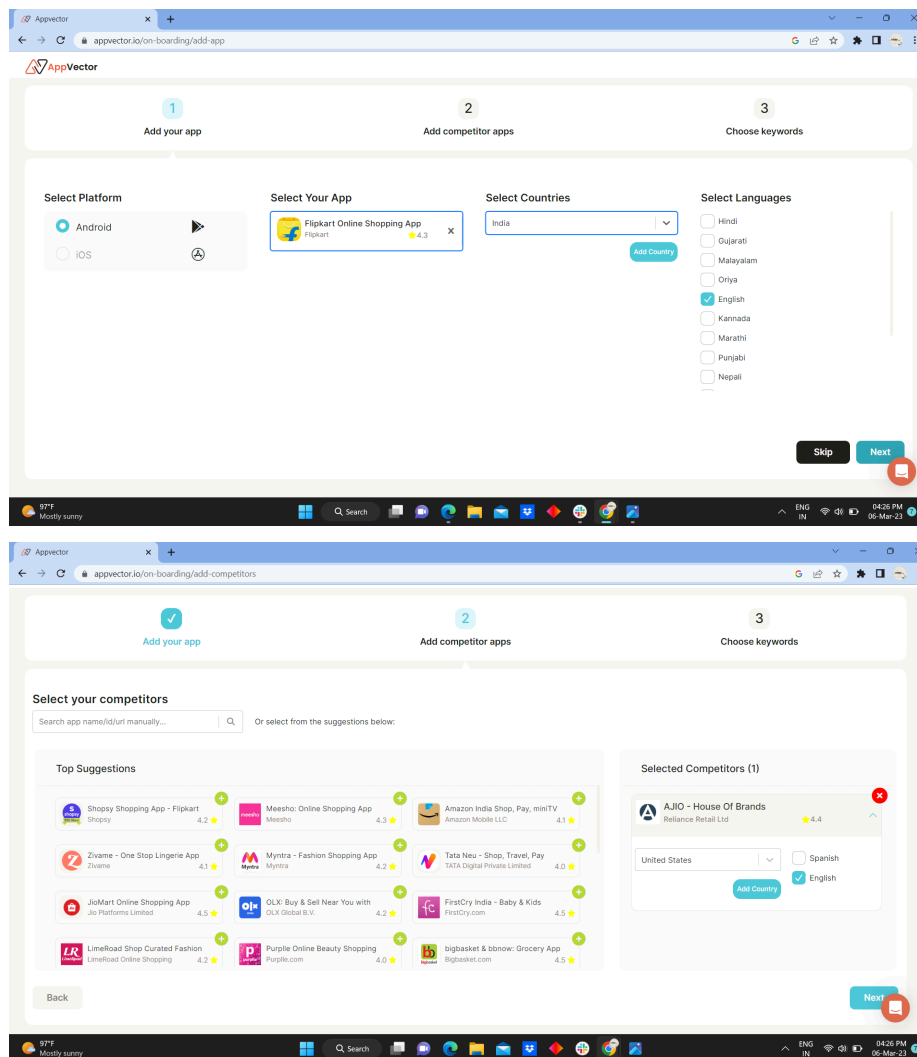

3. When user click on app your app button in dashboard page, they are redirected to onboarding page, here user quickly started to interact by adding app name and suddenly they are getting instruction modal which leading to improper knowledge transfer to user as they already started adding app by own consciousness. (Still some user managed well)

User need to see instruction modal at first and after reading / closing it they should be let into the onboarding page.

4. User are not concentrating on competitor country and language, 4 out of 3 Users didn't even check whether their own app country, language and competitor's country, language are the same. User are left with default country & language for competitor while they selected different for own app

Need to show the same country and language which they selected for their own app in the select competitors page. - Still user can select/ deselect their preferences

Eg- User selected **India English** for own app and for competitor as default **Us English** is there, if user missed here, he again need to visit here

5. User spending more time in understanding Blacklist / Whitelist term,

We can try new by google optimise

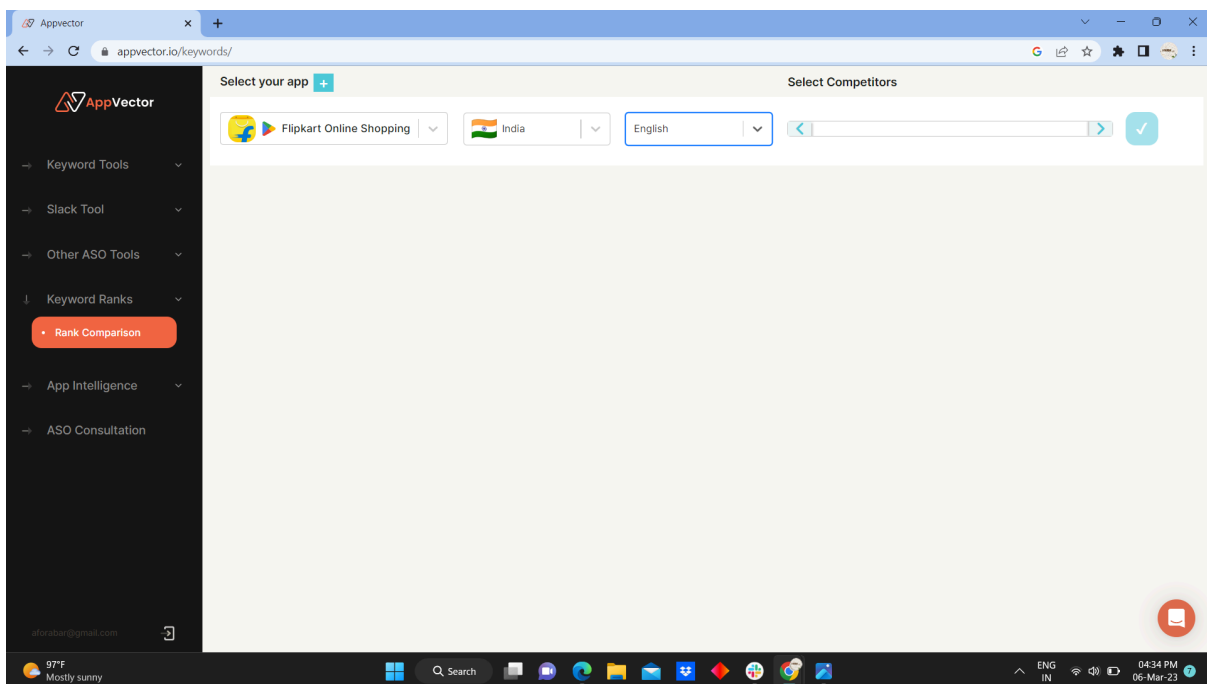

Main page

1. When user check keyword rank or any feature with adding app, We need to promote add your app button. (User exploring without any data and taking more time to add own app)

Need to promote add your app button for new user

2. Without selecting competitor if user closed or went back, the app switcher page look unfinished,

Instead we can show blank app switcher and again take him to onboarding process

3. Visually user find hard to understand the done button on app switcher (More dead clicks are registered)

We can use submit button of better visual understanding

4. Modal to inform that all keyword rank will be available after 24 hours and take user to explore other features
